

COMING SOON IN 2026

# SYNOGLIDE™

## Adaptive hydrogel therapy that's **made to move**

**Synoglide™** is a first-of-its-kind microparticle hydrogel veterinary device for the management of equine osteoarthritis. Clinically shown to help restore natural biomechanics for improved joint function, **Synoglide provides protection that performs under pressure.**

### ENGINEERED TO BEHAVE LIKE BIOLOGY

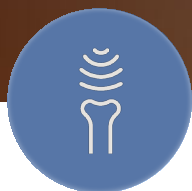

To manage equine osteoarthritis, Synoglide is designed to work in harmony with a horse's natural joint movement. With a self-healing microparticle structure that works from within the joint, Synoglide integrates with the synovial fluid to improve shock absorption. In high-stress situations, Synoglide's bonds adapt and reform as the joint moves to deliver support with every stride.

### A FIRST-OF-ITS-KIND OA MICROPARTICLE HYDROGEL

**Integrates with synovial fluid** with naturally derived, biodegradable ingredients

**Helps restore natural shock absorption** with dynamic, self-healing microparticle technology

**Adapts and strengthens under mechanical stress** to provide extra support when the joint needs it most

**Provides relief** with results that help improve joint function

# SYNOGLIDE™

## Designed for strength. Made for movement.

With a first-of-its-kind technology that delivers viscoelasticity and rheopectic qualities similar to synovial fluid, **Synoglide™** can help restore natural biomechanics for improved joint function.<sup>1</sup>

### IN A CLINICAL STUDY OF 29 HORSES:

# 89.6%

showed lameness reduction 4 weeks after treatment (26 horses)<sup>1</sup>

# 72.4%

showed complete resolution of lameness (21 horses)<sup>1</sup>

**Synoglide** is effective in managing equine OA, significantly reducing lameness, and improving joint health.

### A STEP FORWARD IN INTRA-ARTICULAR TECHNOLOGY

By working to help improve joint health through adaptive, self-renewing microparticle technology, **Synoglide** is a compelling new veterinary device for the management of OA.

Indication: Synoglide is indicated for intra-articular injection for the management of non-infectious causes of osteoarthritis in horses and must be used only under the supervision of a licensed veterinarian.

As with any intra-articular procedure, infection risk exists. Use strict aseptic technique.

1. Unblinded study of 29 mature thoroughbreds with lameness assessed on the AAEP scale at 1-4 out of 5 due to OA and confirmed with radiographs (hocks and fetlocks). Data on File.
